APES Topic 4: Ecology - Ecosystems (structure, function, interactions)
Mr. Romano

## Aim: What are the properties of the major subdivisions of the Earth?

Lithosphere
solid outer part of Earth
(Earth's crust and upper mantle)
thickness $=40-280 \mathrm{~km}$
most abundant elements: silicon and oxygen
location of fossil fuels and mineral resources

## 3. <br> Atmosphere

shell of gases surrounding Earth that extends up from Earth's surface approximately 480km

## d. THERMOSPHERE

## c. MESOSPHERE

## b. STRATOSPHERE

OZONE LAYER ( $\mathrm{O}_{3(9)}$ ) (lower part of stratosphere) - absorbs harmful UV rays
a. TROPOSPHERE
$78 \%$ nitrogen location of life, weather, pollutants
21\% oxygen
$1 \%$ other
(water vapor, argon, carbon dioxide)

## 4. BIOSPHERE / ECOSPHERE

the portion of Earth where living organisms exist and interact with each other and with their nonliving environment

## Ecotone

the transitional zone in which one ecosystem merges with an adjacent one

TO SUSTAIN LIFE ON EARTH:

1. The Sun -
**since energy can't be recycled** $\rightarrow$ it's just degraded and dispersed
2. Nutrient Cycling (a.k.a. biogeochemical cycles)
3. Gravity
